SmartPrivateAI Concept Guide

By PrivateAI

Version 1.0 – July 2025

What Is SmartPrivateAI?

SmartPrivateAI turns your smartphone into a **private, intelligent assistant** that works day and night — without needing the cloud.

It's built on privacy-first principles using **local language models (LLMs)**, and can also connect to the internet for enhanced functionality when needed.

Night Mode: Use While You Sleep

- Let your smartphone **work while you rest**.
 - Charge your phone as usual.
 - SmartPrivateAI can run scripts or agents to handle:
 - Daily summaries
 - Personalized journaling
 - Private Q&A logs
 - Planning assistance
 - Can operate **offline only** for maximum privacy.
 - Optional: Enable internet access for more powerful tasks.
-

Day Mode: Use During the Day

- Chat privately without sending data to cloud servers.
 - Take notes, plan your day, ask questions — all with no app tracking.
 - Run LLMs like **Llama3**, **Phi-3**, or **TinyLLaMA** depending on your device.
 - Android devices allow for larger models and more flexibility.
 - iPhones (especially newer models) work well with apps like Layla.
-

Privacy & Security

- No accounts, no ads, no cloud required.
 - You control your data — nothing is sent to outside servers.
 - Optional online mode supports:
 - Retrieval-Augmented Generation (RAG)
 - AI agents for research, summarizing, and writing
-

What You'll Need

- A compatible smartphone:
 - Android (Pixel 6 or later recommended)
 - iPhone 13 or newer recommended
 - A simple stand to keep your phone in view while it works.
 - (Optional) A Bluetooth or USB mic for hands-free use.
 - Guides to set everything up (see Full Setup Guide).
-

Want to Set It Up?

Use the **Full Setup Guide** to get SmartPrivateAI working on your phone in just minutes.
